

Software Testing and Verification

Problem Set 5: Axiomatic Verification – Solution Notes

1. a. would not: pre-condition not satisfied
 b. would not: cannot determine if Q holds in this case or not since FINAL value of z is not given
 c. would not: program does not terminate
 d. would: $y < z \Rightarrow Q$ is false
 e. would not: the FINAL value of z may be such that Q holds
 f. would not: Q will hold in this case regardless of the initial value of z
 g. would not: Q will hold in this case when P holds initially, or when $z=0$ initially
 h. would not: Q will hold in this case regardless of the initial value of z

2.

$\{y=temp \wedge temp>x\}$ if temp>z then S1 $\{x \leq y \leq z\}$

Using the if-then ROI, we need to show:

- (1) $\{y=temp \wedge temp>x \wedge temp>z\}$ S1 $\{x \leq y \leq z\}$?
- (2) $(y=temp \wedge temp>x \wedge temp \leq z) \Rightarrow x < y \leq z \Rightarrow Q \checkmark$

For (1) above we have: $\{y=temp \wedge temp>x \wedge temp>z\}$
 $y := z$

$\{y=z \wedge y'=temp \wedge temp>x \wedge temp>z\}$
 $z := temp$

$\{z=temp \wedge y=z' \wedge y'=temp \wedge temp>x \wedge temp>z'\} \Rightarrow \{z=temp \wedge temp>x \wedge temp>y\}$

if x>y then S2
 $\{x \leq y \leq z\}$?

Using the if-then ROI a second time, we need to show:

- (3) $\{z=temp \wedge temp>x \wedge temp>y \wedge x>y\} S2 \{x \leq y \leq z\} ?$
 (4) $(z=temp \wedge temp>x \wedge temp>y \wedge x \leq y) \Rightarrow x \leq y < z \Rightarrow Q \checkmark$

For (3) above we have:

$$\begin{aligned}
 & \{z=temp \wedge temp>x \wedge temp>y \wedge x>y\} \\
 & \quad temp := x \\
 & \{temp=x \wedge z=temp' \wedge temp'>x \wedge temp'>y \wedge x>y\} \Rightarrow \{temp=x \wedge z>x \wedge z>y \wedge x>y\} \\
 & \quad x := y \\
 & \{x=y \wedge temp=x' \wedge z>x' \wedge z>y \wedge x'>y\} \Rightarrow \{x=y \wedge z>temp \wedge z>y \wedge temp>y\} \\
 & \quad y := temp \\
 & \{y=temp \wedge x=y' \wedge z>temp \wedge z>y' \wedge temp>y'\} \Rightarrow \{y=temp \wedge z>temp \wedge z>x \wedge temp>x\} \\
 & \quad \Rightarrow \{x<y<z\} \Rightarrow Q \checkmark
 \end{aligned}$$

3. Let $I = (Found \wedge Key=List[Index]) \vee (\sim Found \wedge \forall Index < i \leq N, key \neq List[i])$

INITIALIZATION: Does $P \Rightarrow I$?

$$\begin{aligned}
 P &= N \geq 1 \wedge \sim Found \wedge Index=N \\
 &\Rightarrow (\sim Found \wedge \forall Index < i \leq N, key \neq List[i]) \\
 \text{So } P &\Rightarrow I.
 \end{aligned}$$

PRESERVATION: Does $\{I \wedge b\} s \{I\}$?

$$\begin{aligned}
 I \wedge b &= \{[(Found \wedge Key=List[Index]) \vee (\sim Found \wedge \forall Index < i \leq N, \\
 & \quad Key \neq List[i])] \wedge Index > 0 \wedge \sim Found]\} \\
 &= \{(\sim Found \wedge \forall Index < i \leq N, Key \neq List[i]) \wedge Index > 0\}
 \end{aligned}$$

To show: $\{I \wedge b\}$

```

if Key=List[Index] then
  Found := true
else
  Index := Index-1
End_if_else

{I}

```

we must, by the if-then-else Rule of Inference, show:

- (1): $\{I \wedge b \wedge Key=List[Index]\} Found := true \{I\}$, and
 (2): $\{I \wedge b \wedge Key \neq List[Index]\} Index := Index-1 \{I\}$

For (1) we have:

$$\{\sim\text{Found} \wedge (\forall \text{Index} < i \leq N, \text{Key} \neq \text{List}[i]) \wedge \text{Index} > 0 \wedge \text{Key} = \text{List}[\text{Index}]\}$$

Found := true

$$\{\text{Found} \wedge (\forall \text{Index} < i \leq N, \text{Key} \neq \text{List}[i]) \wedge \text{Key} = \text{List}[\text{Index}] \wedge \text{Index} > 0\} \Rightarrow I$$

For (2) we have:

$$\{\sim\text{Found} \wedge (\forall \text{Index} < i \leq N, \text{Key} \neq \text{List}[i]) \wedge \text{Index} > 0 \wedge \text{Key} \neq \text{List}[\text{Index}]\}$$

Index := Index-1

$$\{\sim\text{Found} \wedge (\forall \text{Index} < i \leq N, \text{Key} \neq \text{List}[i]) \wedge \text{Index} \geq 0\} \Rightarrow I$$

So $\{I \wedge b\} \leq \{I\}$.

FINALIZATION: Does $(I \wedge \sim b) \Rightarrow Q$?

$$I \wedge \sim b = \{[(\text{Found} \wedge \text{Key} = \text{List}[\text{Index}]) \vee (\sim\text{Found} \wedge \forall \text{Index} < i \leq N, \text{Key} \neq \text{List}[i]) \wedge (\text{Index} \leq 0 \vee \text{Found})]\}$$

$$\Rightarrow \{[(\text{Found} \wedge \text{Key} = \text{List}[\text{Index}]) \vee (\sim\text{Found} \wedge \forall 1 \leq i \leq N, \text{Key} \neq \text{List}[i])\} = Q$$

4.

$$\text{ROI: } \frac{\{P\} \leq \{I\}, \{I \wedge \sim b\} \leq \{I\}, (I \wedge b) \Rightarrow Q}{\{P\} \text{ repeat } s \text{ until } b \{Q\}}$$

Let $I =$

$$[(\text{Found} \wedge \text{Key} = \text{List}[\text{Index}]) \vee (\sim\text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, N], \text{key} \neq \text{List}[i])] \wedge \text{iorder}$$

INITIALIZATION: Does $\{P\} \leq \{I\}$?

$$\{N \geq 1 \wedge \text{iorder} \wedge \text{First} = 1 \wedge \text{Last} = N \wedge \sim\text{Found}\}$$

$$\text{Index} := (\text{First} + \text{Last}) \text{ div } 2$$

$$\{N \geq 1 \wedge \text{iorder} \wedge \text{First} = 1 \wedge \text{Last} = N \wedge \sim\text{Found} \wedge \text{Index} = (1 + N) \text{ div } 2\} = P1$$

To show: $\{P1\}$

```

    if Key=List[Index] then
      Found := true
    else
      if Key<List[Index] then
        First := Index+1
      else
        Last := Index-1
      end-if-else
    end-if-else

```

$\{I\}$

we must show:

- (1): $\{P1 \wedge \text{Key}=\text{List}[\text{Index}]\} \text{ Found} := \text{true} \{I\}$, and
 (2): $\{P1 \wedge \text{Key} \neq \text{List}[\text{Index}]\} \text{ if...then...else... } \{I\}$

For (1) we have:

$$\{N \geq 1 \wedge \text{iorder} \wedge \text{First}=1 \wedge \text{Last}=N \wedge \sim \text{Found} \wedge \text{Index}=(1+N)\text{div}2 \wedge \text{Key}=\text{List}[\text{Index}]\}$$

$\text{Found} := \text{true}$

$$\{N \geq 1 \wedge \text{iorder} \wedge \text{First}=1 \wedge \text{Last}=N \wedge \text{Found} \wedge \text{Index}=(1+N)\text{div}2 \wedge \text{Key}=\text{List}[\text{Index}]\} \Rightarrow \text{Found} \wedge \text{Key}=\text{List}[\text{Index}] \wedge \text{Iorder} \Rightarrow I$$

For (2) we must show:

- (a) $\{P1 \wedge \text{Key} < \text{List}[\text{Index}]\} \text{ First} := \text{Index}+1 \{I\}$, and
 (b) $\{P1 \wedge \text{Key} > \text{List}[\text{Index}]\} \text{ Last} := \text{Index}-1 \{I\}$

For (a) we have:

$$\{N \geq 1 \wedge \text{iorder} \wedge \text{First}=1 \wedge \text{Last}=N \wedge \sim \text{Found} \wedge \text{Index}=(1+N)\text{div}2 \wedge \text{Key} < \text{List}[\text{Index}]\}$$

$\text{First} := \text{Index}+1$

$$\{N \geq 1 \wedge \text{iorder} \wedge \text{First}=(1+N)\text{div}2+1 \wedge \text{Last}=N \wedge \sim \text{Found} \wedge \text{Index}=(1+N)\text{div}2 \wedge \text{Key} < \text{List}[\text{Index}]\} \Rightarrow$$

$$\{\sim \text{Found} \wedge \forall i \in [1, (1+N)\text{div}2+1) \cup (\text{Last}, N], \text{key} \neq \text{List}[i]) \wedge \text{iorder}\} =$$

$\{\sim\text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, N], \text{key} \neq \text{List}[i]) \wedge \text{iorder}\} \Rightarrow I$

For (b) we have:

$\{N \geq 1 \wedge \text{iorder} \wedge \text{First} = 1 \wedge \text{Last} = N \wedge \sim\text{Found} \wedge \text{Index} = (1+N) \text{div} 2 \wedge \text{Key} > \text{List}[\text{Index}]\}$

$\text{Last} := \text{Index} - 1$

$\{N \geq 1 \wedge \text{iorder} \wedge \text{First} = 1 \wedge \text{Last} = (1+N) \text{div} 2 - 1 \wedge \sim\text{Found} \wedge \text{Index} = (1+N) \text{div} 2 \wedge \text{Key} > \text{List}[\text{Index}]\} \Rightarrow$

$\{\sim\text{Found} \wedge \forall i \in [1, \text{First} \cup ((1+N) \text{div} 2 - 1, N], \text{key} \neq \text{List}[i]) \wedge \text{iorder}\} =$

$\{\sim\text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, N], \text{key} \neq \text{List}[i]) \wedge \text{iorder}\} \Rightarrow I$

PRESERVATION: Does $\{I \wedge \sim b\} \text{ s } \{I\}$?

$\{[(\text{Found} \wedge \text{Key} = \text{List}[\text{Index}]) \vee (\sim\text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, N], \text{key} \neq \text{List}[i])]\} \wedge \text{iorder} \wedge \sim(\text{Found} \text{ or } \text{First} > \text{Last})\}$

$\text{Index} := (\text{First} + \text{Last}) \text{ div } 2$

$\{(\sim\text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, N], \text{key} \neq \text{List}[i]) \wedge \text{iorder} \wedge \text{First} \leq \text{Last} \wedge \text{Index} = (\text{First} + \text{Last}) \text{div} 2\} = P2$

To show: $\{P2\}$

```

if Key = List[Index] then
  Found := true
else
  if Key < List[Index] then
    First := Index + 1
  else
    Last := Index - 1
  end-if-else
end-if-else

```

$\{I\}$

we must show:

- (1): $\{P2 \wedge \text{Key} = \text{List}[\text{Index}]\} \text{ Found} := \text{true} \{I\}$, and
- (2): $\{P2 \wedge \text{Key} \neq \text{List}[\text{Index}]\} \text{ if...then...else... } \{I\}$

For (1) we have:

$$\{(\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i]) \wedge \text{iorder} \wedge \text{First} \leq \text{Last} \wedge \text{Index} = (\text{First} + \text{Last}) \text{div} 2 \wedge \text{Key} = \text{List}[\text{Index}]\}$$

Found := true

$$\{(\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i]) \wedge \text{iorder} \wedge \text{First} \leq \text{Last} \wedge \text{Index} = (\text{First} + \text{Last}) \text{div} 2 \wedge \text{Key} = \text{List}[\text{Index}] \wedge \text{Found}\} \Rightarrow$$

$$\{\text{Found} \wedge \text{Key} = \text{List}[\text{Index}] \wedge \text{iorder}\} \Rightarrow I$$

For (2) we must show:

- (a) $\{P2 \wedge \text{Key} < \text{List}[\text{Index}]\} \text{First} := \text{Index} + 1 \{I\}$, and
- (b) $\{P2 \wedge \text{Key} > \text{List}[\text{Index}]\} \text{Last} := \text{Index} - 1 \{I\}$

For (a) we have:

$$\{(\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i]) \wedge \text{iorder} \wedge \text{First} \leq \text{Last} \wedge \text{Index} = (\text{First} + \text{Last}) \text{div} 2 \wedge \text{Key} < \text{List}[\text{Index}]\}$$

First := Index + 1

$$\{(\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i]) \wedge \text{iorder} \wedge \text{Key} < \text{List}[\text{Index}]\} \Rightarrow I$$

For (b) we have:

$$\{(\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i]) \wedge \text{iorder} \wedge \text{First} \leq \text{Last} \wedge \text{Index} = (\text{First} + \text{Last}) \text{div} 2 \wedge \text{Key} > \text{List}[\text{Index}]\}$$

Last := Index - 1

$$\{(\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i]) \wedge \text{iorder} \wedge \text{Key} > \text{List}[\text{Index}]\} \Rightarrow I$$

FINALIZATION: Does $(I \wedge b) \Rightarrow Q$?

$$I \wedge b = [(\text{Found} \wedge \text{Key} = \text{List}[\text{Index}]) \text{ OR } (\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i])] \wedge \text{iorder} \wedge (\text{Found} \text{ or } \text{First} > \text{Last})$$

$$= [(\text{Found} \wedge \text{Key} = \text{List}[\text{Index}]) \text{ OR } (\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} < > \text{List}[i])] \wedge \text{iorder} \wedge \text{Found} \wedge \text{First} \leq \text{Last}$$

$$= (\text{Found} \wedge \text{Key}=\text{List}[\text{Index}] \wedge \text{iorder} \wedge \text{First} \leq \text{Last}) \Rightarrow Q$$

OR

$$[(\text{Found} \wedge \text{Key}=\text{List}[\text{Index}]) \text{ OR } (\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} \neq \text{List}[i])] \wedge \text{iorder} \wedge \sim \text{Found} \wedge \text{First} > \text{Last}$$

$$= (\sim \text{Found} \wedge \forall 1 \leq i \leq \text{N}, \text{key} \neq \text{List}[i] \wedge \text{iorder} \wedge \text{First} > \text{Last}) \Rightarrow Q$$

OR

$$[(\text{Found} \wedge \text{Key}=\text{List}[\text{Index}]) \vee (\sim \text{Found} \wedge \forall i \in [1, \text{First}) \cup (\text{Last}, \text{N}], \text{key} \neq \text{List}[i])] \wedge \text{iorder} \wedge \text{Found} \wedge \text{First} > \text{Last}$$

$$= (\text{Found} \wedge \text{Key}=\text{List}[\text{Index}] \wedge \text{iorder} \wedge \text{First} > \text{Last})$$

$$\Rightarrow (\text{Found} \wedge \text{Key}=\text{List}[\text{Index}]) \vee (\sim \text{Found} \wedge \forall 1 \leq i \leq \text{N}, \text{key} \neq \text{List}[i]) = Q$$

5. a. The program will terminate for *ANY* initial values of integer variables x and y .
- b. No. If $y_0 \geq 0$, the predicate " $y < 0$ " evaluates to false and the program terminates immediately. However, if $y_0 < 0$, y does not satisfy the "monotonically increasing" condition for a measure bounded from above (by the predicate " $y < 0$ ") since x_0 may not be positive. A simple generalization of the Method stated in class that would allow its use in this case would be:

...identify a *measure* based on one or more program variables that satisfies the following properties:

1. monotonically decreases (or increases) with each iteration **after a finite number of initial iterations**,
2. is bounded from below (or above), and
3. can assume only a finite number of values before reaching the bound.

6.

$$\begin{array}{c} P \Rightarrow (\sim b \wedge Q) \\ \hline \text{a.} \quad \{P\} \text{ while } b \text{ do } s \{Q\} \end{array} \quad ?$$

The rule is valid, since the antecedent implies that whenever the pre-condition, P , holds, the false branch will be executed and Q holds. The rule could be employed, for example, to prove:

$$\{x=17\} \text{ while } x < 0 \text{ do } x := 0 \{x > 0\}$$

$$\begin{array}{c}
 \{P \wedge b\} s \{I\}, \{I \wedge b\} s \{I\}, (I \wedge \sim b) \Rightarrow Q \\
 \hline
 \{P\} \text{ while } b \text{ do } s \{Q\}
 \end{array}$$

The rule is NOT valid. Proof:

```

{y≠17}           I: y=17
  while x>0 do
    y := 17
    x := x-1
  end_while
{y=17}

```

The three antecedents hold for the invariant $y=17$ but the consequent does not since the initial value of x may be ≤ 0 initially, in which case Q would not hold on termination.
